EXP.NO:12

MAJORITY ELEMENT

PROBLEM STATEMENT:

Given an array `nums` of size `n`, return *the majority element*.

The majority element is the element that appears more than `⌊n / 2⌋` times. You may assume that the majority element always exists in the array.

Example 1:

```
Input: nums = [3,2,3]
Output: 3
```

Example 2:

```
Input: nums = [2,2,1,1,1,2,2]
Output: 2
```

Constraints:

- `n == nums.length`
- `1 <= n <= 5 * 10^4`
- `-2^31 <= nums[i] <= 2^31 - 1`

For example:

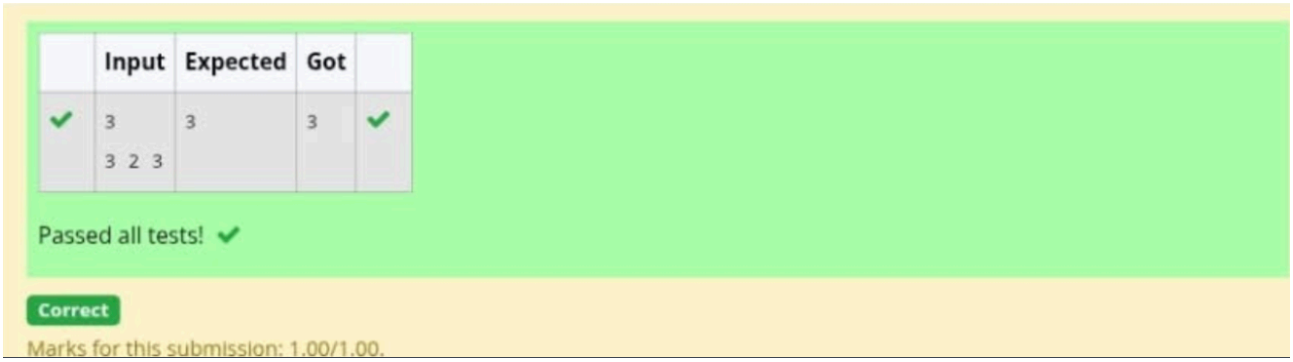

Input	Result
3 3 2 3	3
7 2 2 1 1 1 2 2	2

EXP.NO:12

CODE:

```c
#include<stdio.h>
int main(){
    int n,res,c;
    scanf("%d",&n);
    int arr[n];
    for(int i=0;i<n;i++){
        scanf("%d",&arr[i]);
    }
    for(int i=0;i<n;i++){
        c=0;
        for(int j=0;j<n;j++){
            if(arr[i]==arr[j]){
                c++;
            }
        }
        if(c>(n/2)){
            res=arr[i];
        }
    }
    printf("%d",res);
}
```

OUTPUT:

RESULT:

The code is executed successfully.
